

Unit

1

Lesson

3

Spark The Challenge!

Designing with Heart.

Time Frame: [90 min]

Lesson Objectives:

By the end of this lesson students will be able to:

- Observe and describe how a ramp helps someone in a wheelchair move more easily.
- Recognize barriers in common spaces that make it hard for some people to move or reach.
- Look at different ramp heights and sizes to find out which one works best.
- Recognize what a simulation is and how it helps designers test their ideas.
- Compare different design materials based on their physical properties to choose the best one for a prototype.

Challenge questions of the lesson

1. How can we use Tinkercad to design a ramp that is just the right size and shape to help someone safely move into a room, and how can we change our ramp to make it even better after trying it out?

SEL Relation

- Self-Awareness: Recognize and understand personal feelings about accessibility and inclusion.
- Self-Management: Demonstrate patience, focus, and persistence while working on accessibility solutions using tools like Tinkercad.
- Social Awareness: Show empathy and respect for diverse needs by considering how accessible designs help others.
- Relationship Skills: Communicate ideas clearly, listen to others, collaborate, and work effectively as a team.
- Responsible Decision-Making: Make thoughtful, ethical choices to solve accessibility challenges and improve designs based on feedback.

Engage

Teacher's Role:

- Narrate the story of Lila and Mariam with expression, emphasizing empathy and design thinking.
- Prompt students to reflect on the story by asking how they could improve spaces for people like Uncle Sam.
- Create a warm, inclusive space for students to share their ideas and relate to the scenario.

Expected From Students:

- Listen actively and respond to questions with empathy.
- Reflect on the needs of someone using a wheelchair.
- Share personal experiences or ideas to improve accessibility.

Parts of the books included.

Story

1. Set the Scene with Curiosity and Care

- Tell students they are now young designers helping make homes more accessible.
- Prompt curiosity with: “What would a room need if someone used a wheelchair?”

2. Read the Story Aloud with Expression

- Use props or gesture to enhance engagement while reading.
- Pause to ask “What do you think will happen next?” or “How do you think Uncle Sam feels?”

Possible Strategies for Implementation:

1. Picture Sorting for Empathy Building

- How to Implement: Use the “cut and paste” activity to prompt discussion. Ask: “Which items really help? Which ones don’t?” Let students justify their answers with short explanations.

2. Emotion Check-In Through Uncle Sam’s Perspective

- How to Implement: Ask the reflection question: “How do you think Uncle Sam would feel if his room was designed just for him?” Give students sentence starters like:
 - “He would feel _____ because...”
 - “It would help him _____.”

Discuss their answers together to deepen emotional understanding.

Story Reflection

Objective:

To build empathy and spark design-based thinking.

Answers:

Students may say: “Add a ramp,” “Make shelves lower,” “Make doors wider.”

Possible Strategies for implementation:

1. Set the Scene with Empathy

- Begin with a class discussion:
“Let’s imagine someone in a wheelchair wants to use our classroom or home. What might be tricky for them? How can we help?”
- Use real objects or images of ramps, wide doors, or special desks to spark ideas.

2. Visual + Verbal Thinking Options

- Offer two response modes:
 - Drawing for visual thinkers or early writers
 - Simple sentence starters like:
“I would add a...” or “It would help because...”

3. Think-Pair-Share Reflection

- Allow students to think silently, then talk with a partner before drawing/writing.
 - Ask: “What did your friend say they would add?”

4. Model an Example

- Show a completed version on the board, e.g.,
“I would add a low sink so someone in a wheelchair can wash their hands.”
 - This supports modeling without copying.

5. Inclusion for Diverse Learners

- Use printed picture choice cards of possible add-ons (ramp, automatic door, low shelf) for emerging writers or multilingual learners.
- Allow students to cut and glue their choice and then label or describe it.

**Let's
Think!**

Objective:

Students will identify which objects make a space more accessible and suggest new ideas to support someone in a wheelchair.

Activity resources:

https://drive.google.com/file/d/1V_X2izu_LCi5PfpCXmBSpxisbQZmhSMg/view?usp=drive_link

Answers:

- Helpful items:
 - Ramp
 - Lower sink
 - Open-bottom sink
 - Low shelf
- Not as helpful:
 - Couch
 - High cabinet

Activity Instructions:

1. Introduce the Task

- Say:

“Today we’ll be thinking like room designers! Your job is to help make this room easier for someone in a wheelchair to use.”
- Show students the page and explain that they will look at pictures of different furniture and features.

2. Discuss Each Picture Together

- Show or project the cut-out sheet and go over each image.
- Ask questions like:
 - “Is this easy to reach from a wheelchair?”
 - “Would this make moving around easier or harder?”

3. Model the Cutting and Gluing

- Demonstrate how to carefully cut out each picture.
- Show how to paste the helpful ones inside the room layout.
- Encourage neat gluing and thoughtful placement (e.g., sink near the wall, ramp near the door).

4. Add a Personal Touch

- After gluing the helpful items, ask students to draw or write one more idea they have to make the room better for everyone (e.g., automatic door, grab bar, voice button).

5. Share and Reflect

- Have students turn and talk:
 - “Why did you choose these items?”
 - “How does your design help someone in a wheelchair?”

Tips for Success:

- Support students who may need help with cutting or placement by pairing them up.
- Encourage creativity while keeping the focus on accessibility.
- Use real-life examples to build empathy and understanding.

Possible Strategies for Implementation:

1. Visual Thinking and Discussion (Before the Activity)

Strategy: Picture Talk

- How to Implement:
 - Display each furniture picture and ask guiding questions:
 1. “What is this?”
 2. “Would this help someone using a wheelchair?”
 - Use “Yes/No” hand signals or thumbs up/down to keep all students engaged.

2. Modeling and Guided Practice

Strategy: I Do – We Do – You Do

- How to Implement:
 1. I Do: Show how to choose a helpful item and explain your thinking.
 2. We Do: Choose one item as a class and decide where to place it in the room.
 3. You Do: Let students work independently or in pairs.

3. Student Collaboration

Strategy: Think-Pair-Design

- How to Implement:
 - Have students work in pairs:
 1. Think: Which items help?
 2. Pair: Talk with a partner about choices.
 3. Design: Work together to place and draw ideas in the room.

4. Differentiation by Support and Expression

Strategy: Offer Multiple Means of Action and Expression (UDL)

- How to Implement:
 - Some students may:
 1. Cut and paste pictures
 2. Draw their own features
 3. Verbally explain their thinking to an adult or peer
 4. Use sentence starters like “I added ____ to help ____.”

5. Empathy and Role Play

Strategy: “Step Into Their Shoes” Reflection

- How to Implement:
 - Prompt with:
 1. “Pretend you’re in a wheelchair. Which sink would you want to use?”
 2. “If the shelf is very high, how would you reach it?”

6. Movement Integration

Strategy: Room Walk Simulation

- How to Implement:
 - Tape a simple room layout on the floor.
 - Use props (small chair, box ramp) and let students pretend to move through the room as if using a wheelchair.
 - Reflect afterward: “Was it easy to reach things?”

Explorer's Toolkit

Teacher's Role:

- Set up and explain the purpose of the Tinkercad wheelchair simulation.
- Model how to move the wheelchair using W, A, S, D keys.
- Prompt students to observe and record what helps or hinders movement.
- Facilitate discussions about inclusive design and real-life applications.
- Support student reflection and partner idea-sharing

Expected From Students:

- Use keyboard controls to move the wheelchair in the Tinkercad simulation.
- Observe obstacles and access points.

- Reflect in writing or drawing: Can the wheelchair reach the door easily?
- Collaborate with a partner to brainstorm improvements for accessibility.
- Share at least one idea to make the house easier for someone to use.

Parts of the books included.

DIY Lab

Objective:

Students will use a digital simulation in Tinkercad to test accessibility features (like ramps or wide doors) and evaluate how design affects wheelchair movement.

Activity link: <https://www.tinkercad.com/things/48CgSSfV/Lal-base-world-for-chase>

Materials Needed:

- Laptops or tablets with internet access
- Reflection page in the book.
- Projector or large screen to demo the simulation
- Keyboard access (for W, A, S, D movement)

Activity Instructions:

1. Introduce the Concept

Say: “Today, you’ll test how easy it is to move a wheelchair inside a house. Designers use simulations like this before they build something in real life.”

2. Set the Purpose

- **Explain:** “We’re checking if the house is easy for a wheelchair to use. If it’s hard to get to the door or turn corners, we’ll think of ways to fix it.”

3. Guide Access to the Game

- Open this Tinkercad simulation link.

- Click Copy and Tinker.

- To open SimLab click on this icon.

- Show how to use the **W = forward**, **A = left**, **S = backward**, **D = right** keys to move.
- Let students explore the environment for 2 minutes.

4. Support Student Engagement

- Ask guiding questions like:
 - “Where did the wheelchair get stuck?”
 - “What helped it move easily?”
 - “What changes would make the house better?”

5. Post-Game Reflection (Optional)

- Students write or draw their observations:
 - Was it easy to reach the door?
 - What design could help more?

Possible Strategies for Implementation

Strategy: “Simulate & Solve”

- How to Implement:
 - Play the simulation as a whole class first while narrating challenges.
 - Then, let pairs of students test the space independently.
 - Have them note obstacles and draw or write a solution.

Strategy: “Partner Designers”

- How to Implement:
 - After testing, partners talk and share one design idea each to improve access (e.g., wider hallway, voice button at the door).
 - Create a class chart titled “Our House for Everyone” and list their ideas.

Teacher’s Role

- Guide students step by step while watching the video.
- Ask questions that get them thinking about how to make spaces easier for everyone to use.
- Help students link what they see in the video to what they did in their wheelchair activity.
- Highlight how ramps and other simple machines can make life better for people with disabilities.

Expected from Students

- Watch the video carefully and participate in class discussions.
- Spot features in the video that help people using wheelchairs.
- Think about and explain how the video connects to what they built or tested in class.
- Share how ramps or other tools can make moving around easier for everyone.

Parts of the books included.

Screen Lessons

Take a good look at the house in the video. What things do you see that help someone in a wheelchair?

<https://youtu.be/rtd8a-vnv88?feature=shared>

STEAM SCOUTS

19

Screen Lessons

Objective:

Students will analyze real-world accessibility solutions shown in the video, connect these solutions to simple machine principles explored in their DIY lab, and evaluate how design modifications can improve mobility and independence for wheelchair users.

Video link: <https://youtu.be/rtd8a-vnv88?feature=shared>

Possible Strategies for implementation:

1. Pre-Watching: Set a Purpose:

Strategy: Think-Pair-Share with Gallery Walk

- **How to Implement:** Before watching, students individually think about what they learned from their wheelchair simulation lab. Then pairs discuss their observations about accessibility challenges they discovered. Finally, pairs post their key findings on chart paper around the room and conduct a gallery walk to see other teams' discoveries. This primes students to look for solutions in the video that address the problems they identified.

2. During Watching: Active Engagement

Strategy: RallyCoach with Observation Sheet

- **How to Implement:** Pairs watch the video together with one student serving as the "observer" who identifies accessibility features, while the other serves as the "recorder" who documents these features on a structured observation sheet. Students switch roles halfway through the video. The observation sheet includes categories like "Simple Machines Used," "Design Solutions," and "How This Helps Wheelchair Users."

3. Post-Watching: Discussion and Reflection

Strategy: Numbered Heads Together combined with I Used to Think...Now I Think routine

- **How to Implement:** Students work in teams of four, each assigned a number (1-4). Teams discuss the video content and compare it to their DIY lab experience. Then use the "I Used to Think...Now I Think" visible thinking routine to reflect on how their understanding of accessibility and simple machines has evolved. When the teacher calls a number, that student from each team shares their team's insights, ensuring all students are prepared to participate and represent their group's thinking.

Elaborate and Evaluate

Teacher's Role

- Act as a guide and tech helper while students complete the Tinkercad quiz.
- Support students who need help using the platform.
- Watch how students do on the quiz to see who might need extra help later.

- Encourage teamwork when students get stuck or face hard questions.

Expected from Students

- Finish the Tinkercad quiz to show what they know about basic 3D design tools and shapes.
- Work together to solve any tech problems that come up.
- Use what they learned in the quiz to get ready for building their own design.

Parts of the books included.

Apprentice

Objective:

Students will assess their readiness for 3D design work by demonstrating proficiency with Tinkercad's basic functions, tools, and interface through an interactive quiz, ensuring they have the technical foundation needed to successfully design accessibility solutions in their upcoming DIY lab projects.

Activity Link: <https://wordwall.net/resource/58919850/3d-design-with-tinkercad-quiz-designed-by-mrbhilave>

Answers:

Materials Needed:

- Computers, laptops, or tablets for each student or student pair (with internet access).
Projector/Interactive Board.

Activity Instructions

1. Start with What They Already Know

- Remind students of their wheelchair game or simulation.
- Explain that before building ramps or smart spaces, they'll first practice using Tinkercad tools.
- Do a quick "Think-Pair-Share":
 - Think: What do you remember about using Tinkercad?
 - Pair: What shapes or tools might we need to build a ramp?

2. Set the Goal

- Tell students: "Before we build like real designers, we need to know how to use the tools. This quiz helps us check that!"
- Explain that the quiz will focus on:
 - Shapes
 - Tools
 - Moving things around in Tinkercad

3. Play the Quiz in Teams

- Group students into teams of 4 and give each one a number (1 to 4).
- Let everyone start the quiz at the same time.
- Pause between questions so teams can discuss.
- If anyone has a tech problem, call out a number and those students become "tech helpers" to support others.

4. Reflect and Keep Students Active

- After each quiz section, ask:
 - "What did you notice about your answers?"
 - "What do you think you're ready to build?"
 - "What are you still curious about?"
- Use a partner strategy like RallyCoach:
 - One student answers, the other cheers and gives hints. Then switch.

Assessment Step

- Students scoring 80% or higher move on to the building challenge.
- Those below 80% will:
 - Get extra help from classmates who did well in one area.
 - Practice again before starting the next part.

Possible Strategies for Implementation:

1. Connect to What They Already Know

- Remind students of their experience using the wheelchair simulator.
- Before they design, explain they must first show they know how to use Tinkercad tools.
- Use Think-Pair-Share: students think about what they remember from Tinkercad, then talk to a partner about what shapes or tools are needed to build ramps.

2. Explain the Goal

- Tell students: “This quiz checks if you’re ready to start building.”
- Compare them to architects who learn how to use tools before designing.
- Let them know the quiz includes questions about shapes, tools, and moving things in Tinkercad.

3. Make Tech Use Team-Based

- Use the Numbered Heads Together strategy:
 - Group students in teams of 4, each gets a number.
 - Everyone does the quiz, but can talk between questions.
 - If tech problems come up, call a number. That student becomes a helper for the class.

4. Keep Engagement High

- After each quiz section, use See-Think-Wonder:
 - See: “What do you notice about your quiz?”
 - Think: “What does this say about what you’re ready for?”
 - Wonder: “What are you curious about building next?”
- Use RallyCoach: one student answers while the partner supports and gives hints. Then switch roles.

Assessment Tip

- Students who get 80% or more move ahead to build.
- Others get help from classmates who were strong in different skills (shapes, tools, moving items) before starting their design. This helps everyone learn from each other.

Builder

Objective:

Students will apply engineering and design principles to create an accessible house in Tinkercad, using trial and error to test and improve ramp designs, and will explain their choices using evidence and reasoning.

Activity Link: <https://www.tinkercad.com/things/48CgSSfVLal-base-world-for-chase>

Activity Resources for teachers: https://drive.google.com/file/d/1RWisBlpy1g7Vcg-6ji3XTb2hrF0jlkoY/view?usp=drive_link

Possible answers:

1. Can the wheelchair go up the ramp and into the house smoothly?

- **Yes** – The ramp is long enough and not too steep, so the wheelchair can roll easily.
- **No** – If the ramp is too short or steep, it might be hard for the wheelchair to go up smoothly.

2. In real life, what material would be stronger? (The ramp is made of plastic in Tinkercad)

- **Wood** – It's stronger and more stable than plastic.
- **Metal** – Very strong and lasts a long time outdoors.
- **Cardboard** – It bends and breaks easily and is not good for real ramps.
- **Foam** – Too soft and not sturdy.

3. Which ramp works better? (Original vs. longer/lower ramp)

- The second ramp (Length: 109, Height: 32) works better because it's longer and less steep.
- Why: It makes it easier for the wheelchair to go up without too much effort.

Activity Instructions

Step 1: Set Up the Activity

- Remind students of their design challenge: making a house easier to enter for someone using a wheelchair.
- Review how to remove stairs and add shapes in Tinkercad.
- Provide the given ramp measurements (Length: 90, Height: 50, Width: 75).

Step 2: Model the Simulation

- Demonstrate how to run the wheelchair simulation in Tinkercad.
- Ask students to observe how well the ramp works and whether it allows smooth entry.

Step 3: Test Material Strength (Conceptual)

- Discuss that the ramp in Tinkercad is made of plastic by default.
- Ask students what materials might be stronger in real life (e.g., metal, wood).
- Have them write or draw their ideas and optionally simulate a different material.

Step 4: Try a Different Ramp

- Give students the second set of ramp dimensions (Length: 109, Height: 32, Width: 180).
- Let students replace the old ramp with this one and test again.

- Use the CER (Claim, Evidence, Reasoning) method to compare ramps and justify which is better.

Possible Strategies for Implementation

1. Visual Modeling Support

- Provide printed or digital guides showing how to build a ramp in Tinkercad.
- Use a projector to model the task for visual learners.

2. Collaborative Inquiry

- Pair students to work together on one device (Think–Pair–Build strategy).
- Ask guiding questions like “What shape works best for a smooth ramp?” or “What happens if the ramp is too steep?”

3. CER Thinking Scaffold

- Provide sentence starters for each CER step:
 - **Claim:** “I think ramp A is better because...”
 - **Evidence:** “In the test, the wheelchair...”
 - **Reasoning:** “This helps because...”

4. UDL and Differentiation

- Allow students to respond by writing, drawing, or orally sharing their findings.
- Offer different levels of challenge by letting advanced students experiment with their own ramp measurements.

5. Real-Life Connection

- Show photos of real accessible homes or ramps before the activity.
- Invite students to connect the simulation to someone they know who might benefit from such a feature.

Elaborate and Evaluate

Teacher's Role

- Facilitator and Encourager
 1. Guide students in selecting a room (kitchen, bathroom, or toilet) to improve.
 2. Prompt students to think about how different people use a space.
 3. Walk around, ask questions like: “Why did you choose this height?” or “Who would this help?”
 4. Give feedback and cheer on thoughtful, creative solutions.
- Discussion Leader
 1. Host a class discussion or gallery walk.
 2. Invite each student to present their redesign.
 3. Ask them to explain the tools they added and how each one helps.

Expected From Students

- Room Selection and Redesign
 1. Choose one room from their Tinkercad house.
 2. Add at least two helpful features for someone with a disability.
- Feature Implementation
 1. Use design features like lower sinks, wide doorways, or grab bars.
 2. Make space for wheelchair turning.
- Justification and Communication
 1. Share why they chose each feature.
 2. Explain how their design makes the room easier and safer for everyone to use.

Parts of the Books Included:

Showcase

Objective:

Students will apply principles of accessible design by modifying a room to include features that support individuals with mobility challenges, and clearly communicate the reasoning behind their design choices.

Activity Link: Tinkercad Simulation Lab (students use their existing house design)

Activity Instructions:

Step 1: Choose the Room

- Ask students to pick one room from their Tinkercad house (kitchen, bathroom, or toilet).
- Encourage them to think about what would be difficult for someone in a wheelchair or with limited movement.

Step 2: Add Helpful Features

- Guide students to add 2–4 accessible elements, such as:
 - Lower sink/shelf
 - Grab bars near the toilet
 - Space to turn a wheelchair
 - Wide doors or ramps inside the room

Step 3: Label and Describe

- Students should label the new features directly in Tinkercad using text or color codes.
- Ask them to type or write a few sentences explaining:
 - What they changed
 - Who it helps
 - Why it's important

Step 4: Present the Design

- Invite each student or group to present their redesign.
- Use guiding questions like:
 - “What problem did you solve?”
 - “How does your room make life easier for someone with a disability?”

Possible Strategies for Implementation

1. Visual Prompting and Room Mapping

- Show real-world images of accessible bathrooms, kitchens, and toilets before students start designing.
- Use side-by-side “before and after” photos of accessible features.

2. Use Think-Pair-Share

- Before starting the design, ask:

- “What is hard for someone in a wheelchair in this room?”
- “What can we change to help?”
- Let students discuss with a partner before they build.

3. Peer Feedback Circles

- During presentation time, let students rotate and review each other’s designs.
- Provide a simple peer review sheet with:
 - One thing I liked:
 - One idea to make it better:

4. Anchor Chart Support

- Create a class anchor chart listing:
 - “What makes a space accessible?”
 - “Tools that help everyone use a room safely.”

5. Sentence Starters and Drawing Options

- Offer sentence starters like:
 - “I added ____ to help someone who...”
- Allow drawing or labeling on paper as an alternative for students who struggle with typing.

Accessible Room Redesign – Evaluation Rubric.

What We Look For	Super!	Good!	Not Yet
Room Choice Did you pick a room to change?	I chose a room and explained why it was important.	I chose a room.	I didn’t choose a room.
Helpful Features Did you add things that help?	I added 3 or more smart tools and explained how they help.	I added 1–2 helpful tools.	I didn’t add anything helpful yet.
Thinking About Others Did you think about people with different needs?	I thought carefully about what makes things hard and how to help.	I thought about one problem and tried to fix it.	I didn’t show how my design helps others.
Thinking About Others Did you think about people with different needs?	My model is clear, organized, and looks like a real room.	My model is easy to see but needs a little more detail.	My model is messy or unfinished.
Model Design Is your room easy to understand?	I used math to think about size and space in my model.	I used a little math.	I didn’t use math in my model.
Explaining Your Work Did you tell us about your design?	I explained clearly how each feature helps someone.	I explained some of my work.	I didn’t explain my work yet.

Don't forget to go back to the EDP page and add these to planning part.

Plan

6. **Room I Will Change:**
"I will redesign the [kitchen / bathroom / toilet] to make it easier for everyone to use."

7. **What Is Hard in This Room:**
"It is hard for someone in a wheelchair to [reach the sink / turn around / open the door]."

8. **Helpful Things I Will Add:**
"I will add [a lower sink, grab bars, a wide door] to help."

9. **How It Helps People:**
"This helps because [they can reach it / it's safe / it's easy to move]."

Now I Can

Objective:

Students will reflect on what they learned about ramps, accessibility, materials, and simulations by identifying key concepts they can now do confidently. This reflection builds metacognition, reinforces design thinking, and strengthens connections between learning and real-life applications.

Activity Instructions

Step 1: Create a Calm, Supportive Reflection Moment

- Say: "Let's take a moment to think about what we learned. You worked hard designing helpful homes!"
- Create a quiet and supportive space with calming music or a soft tone.

Step 2: Show and Read the Checklist

- Display the "Now I Can" chart on the board or hand out printed copies.
- Read each statement aloud slowly. After each one, ask:
 - "Can you do this now? Give me a thumbs up!"
 - "Who can give an example of how you did this?"

Step 3: Student Marking & Personal Reflection

- Have students check off or color a star next to each "Now I Can" they feel confident about.
- In the box or space below, prompt:
 - "Draw or write one thing you're proud of from this project."
 - Example prompt: "I helped someone by..."

Step 4: Turn & Talk Partner Sharing

- Have students pair up and share:

- o “One thing I learned about making homes fair for everyone is...”

Step 5: Celebrate Their Growth

- Say: “You’re real problem-solvers! You know how to test, compare, and make designs better for everyone.”
- You may give each student a sticker or badge labeled:
 - o “I’m a Ramp Tester!” or “Inclusive Designer!”

Tip for Teachers:

Encourage students to use specific examples from their Tinkercad experience when explaining their choices and observations. Use collaborative structures like Numbered Heads Together and RallyCoach to ensure all students are engaged and contributing.

Relation to Standards

1. English Language Arts (ELA):

- Participate in collaborative conversations about texts.
- Use drawings and written responses to express understanding.

2. Next Generation Science Standards (NGSS):

- K-2-ETS1-2: Develop a simple sketch, drawing, or physical model to illustrate how the shape of an object helps its function.
- K-2-ETS1-3: Analyze data from tests of two objects designed to solve the same problem.

3. ISTE Standards for Students (Technology):

- 1.4 Innovative Designer: Use a design process to generate ideas, test theories, and refine products.
- 1.6 Creative Communicator: Create original works to express ideas using digital tools like Tinkercad.
